Abstract

The Proxy Advisory Industry: Influencing and Being Influenced

This paper examines the evolving proxy advice industry, proxy advisors' influences, and their incentives. Using an innovative method, I identify a panel of investors' purchases of proxy advice. During 2007-2017, the industry has become less concentrated. As of 2017, Institutional Shareholder Services (ISS) controls 63% of the market for mutual funds in the U.S., and Glass Lewis controls 28% of the market. Both ISS and Glass Lewis have strong influences and can respectively sway 21% and 22% of their customers' votes. Furthermore, I show that proxy advisors cater to investors' preferences. Such catering departs from value-maximizing and can decrease underlying firms' value.

A Theory of the Proxy Advice Market when Investors have Social Goals – with John G. Matsusaka

This paper develops a theory of the proxy advice market when some investors have non-pecuniary goals such as environmental sustainability and protection of human rights. We develop a model in which advisory firms choose their production technologies and compete for the business of investors with heterogeneous preferences over returns and social goals. When the market for advice is small, the industry equilibrium consists of small "boutique" firms that provide customized advice to each investment fund, and voting outcomes reflect the distribution of investor preferences. When the market is large, the industry reduces to a single advisory firm using a platform technology, the firm's advice is slanted toward the preferences of funds with non-value-maximizing goals, and voting outcomes overrepresent the preferences of activist funds. We discuss normative principles for assessing proxy advice when value maximization is not the sole objective of investors.

Rational Apathy: The Curse of Shareholder Empowerment in Uncontested Board Elections

In contrast to popular belief, this paper shows that there does not exist an unambiguous positive relationship between an unbiased shareholder's voting power and the quality of corporate governance. I utilize a 2010 NYSE policy change that increased shareholders' voting power in uncontested board elections, and, to establish the causality, I take advantage of the exogenous election cycles for director elections. I find that an increase in individual shareholder's voting power will worsen some measures of corporate governance (CEO's pay-performance sensitivity and probability of removing poison pills). I show that this is due to shareholders' decreased participation in both the sponsorship of governance proposals and active voting in annual meetings. I argue that the negative relationship between shareholders' voting power and their participation is due to a free-rider problem in the collective action.

Endogenous Risk-Exposure and Systemic Instability

Most research on financial systemic stability assumes an economy in which banks are subject to exogenous shocks, but in practice, banks choose their exposure to risk. This paper studies the determinants of this endogenous risk exposure when banks are connected in a financial network. I show that there exists a network risk-taking externality. Banks in financial networks, particularly densely connected ones, endogenously expose to greater risks. Furthermore, they choose correlated risks, aggravating the systemic fragility. Banks, however, do have incentives to form networks to protect their charter values. The theory yields several novel perspectives on policy debates.
